CONFIRMATION OF NEUROLOGICAL DETERMINATION OF DEATH INFANT (NDD)

Infants age < 1 year and Term Newborns > 36 Weeks Gestation

See reverse for CCDT Guidelines

**A separate form must be completed by each physician.**

For these age groups, the first and second physician’s determinations, as defined by a full clinical examination including the apnea test, must be performed at 2 different points in time. For infants, there is no fixed interval regardless of the primary etiology. For term newborns, the first examination should be delayed 48 hours after birth and the interval should be ≥ 24 hrs, regardless of primary etiology.

**Section One: Minimum Clinical Criteria - Infants**

a. Deep unresponsive coma with the following established etiology: ___________________________________________________________________

b. Temperature (core) ____________________________________

c. Brainstem Reflexes
   - Bilateral absence of motor responses: (excluding spinal reflexes)
   - Absent cough
   - Absent gag
   - Absent Suck (newborns only)
   - Bilateral absence of corneal responses
   - Bilateral absence of vestibulo-ocular responses
   - Bilateral absence of pupillary response to light: (pupils > mid size)
   - Bilateral absence oculocephalic reflex

d. Apnea Testing:
   i. ABG at the start of test: pH___________ PaCO₂ ______________ mmHg
   ii. ABG at completion of test: pH _____________ PaCO₂ ______________ mmHg

e. Confounding factors precluding the diagnosis? □ No □ Yes (If Yes – see Section Two)

**Section Two: Ancillary Tests**

Ancillary tests, to establish the absence of intracranial blood flow, should be performed when **any** of the Minimum Clinical Criteria cannot be completed, or unresolved confounding factors exist.

Ancillary testing has been performed: □ No □ Yes Reason____________________________

Absence of intracranial blood flow has been demonstrated by:
   - Cerebral Radiocontrast 4-vessel Angiography
   - Radionuclide Angiography
   - Other: _______________________ Date and Time Performed ___________________________

**Section Three: Declaration and Documentation**

This patient fulfills the criteria for neurological determination of death:

Physician: ____________________________ Signature: ____________________________ Print name: ____________________________

Time: ________________________________ Date: ________________________________

The time of the first determination is the legal time of death.
CONFIRMATION OF NEUROLOGICAL DETERMINATION OF DEATH INFANT (NDD)

Infants age < 1 year and Term Newborns > 36 Weeks Gestation

Adapted from:
CCDT, "Severe Brain Injury to NDD: Canadian Forum Recommendations" CMAJ 2006

Age Definitions
Infants: ≥ 30 days, < 1 year; Term Newborns > 36 weeks gestation, age < 30 days

Section One: Minimum Clinical Criteria
Established Etiology: Absence of clinical neurological function with a known, proximate cause that is irreversible. There must be definite clinical and/or neuroimaging evidence of an acute central nervous system (CNS) event that is consistent with the irreversible loss of neurological function. NDD may occur as a consequence of intracranial hypertension and/or primary direct brainstem injury.

Deep Unresponsive Coma: A lack of spontaneous movements and absence of movement originating in the CNS such as: cranial nerve function, CNS mediated motor response to pain in any distribution, seizures, decorticate and decerebrate responses. Spinal reflexes, or motor responses confined to spinal distribution, may persist.

Confounding Factors:
1. Unresuscitated shock
2. Hypothermia (core temperature <34°C for infants and <36°C for newborns, by central blood, rectal or esophageal/gastric measurements)
3. Severe metabolic disorders capable of causing a potentially reversible coma. If the primary etiology does not fully explain the clinical picture, and if in the treating physician’s judgment the metabolic abnormality may play a role, it should be corrected or an ancillary test should be performed.
4. Peripheral nerve or muscle dysfunction or neuromuscular blockade potentially accounting for unresponsiveness, or
5. Clinically significant drug intoxications (e.g. alcohol, barbiturates, sedatives). Therapeutic levels and/or therapeutic dosing of anticonvulsants, sedatives and analgesics do not preclude the diagnosis.

Specific to Cardiac Arrest: Neurological assessments may be unreliable in the acute post-resuscitation phase after cardiorespiratory arrest. In cases of acute hypoxic-ischemic brain injury, clinical evaluation for NDD should be delayed for 24 hours or an ancillary test could be performed. Examiners are cautioned to review confounding issues in the context of the primary etiology and examination. Clinical judgment is the deciding factor.

Apnea test:
Optimal performance requires a period of preoxygenation followed by 100% O₂ delivered via the trachea upon disconnection from mechanical ventilation. The certifying physician must continuously observe the patient for respiratory effort. Thresholds at completion of the apnea test must be: \( \text{Pa CO}_2 \geq 60 \text{ mmHg} \) and \( \geq 20 \text{ mmHg} \) above the pre-apnea test level and \( \text{pH} \leq 7.28 \) as determined by arterial blood gases. Caution must be exercised in considering the validity in cases of chronic respiratory insufficiency or dependence on hypoxic respiratory drive.

Section Two: Ancillary Tests
Demonstration of the global absence of intracranial blood flow is considered the standard for determination of death by ancillary testing. The following prerequisite conditions must be met prior to ancillary testing: i) established etiology, ii) deep unresponsive coma, iii) absence of unresuscitated shock and hypothermia. Currently, validated techniques are 4-vessel cerebral angiogram or radionuclide cerebral blood flow imaging. EEG is no longer recommended. NDD can be confirmed by ancillary testing when minimum clinical criteria cannot be completed or confounding factors cannot be corrected.

Section Three: Neurological Determination of Death
The legal time of death is marked by the first determination of death. Existing law states that for the purposes of post-mortem donation, the fact of death shall be determined by two physicians. The first and second physician’s determinations may be performed concurrently. If performed at different points in time, a full clinical examination including the apnea test must be performed, without any fixed examination interval, regardless of the primary etiology. A separate NDD form must be completed by each physician.

Physicians Determining Neurological Death
Minimum level of physician qualifications to perform NDD is full and current licensure for independent medical practice in the relevant Canadian jurisdiction. This excludes physicians who are only on an educational register. The authority to perform NDD cannot be delegated.
